"Science" is the method in which nothing is believed unless no one can prove it wrong.

EXAMPLE: There's a thing called "Gravity" that pulls objects to Earth at a rate of 9M/second squared.

Disprove that.... No one can disprove it. That's why it is science

What modern academics call "science" is the inductive reasoning process of coming up with an idea and attempting to prove it true...which inherently ignores all other explanations.

For EXAMPLE: I might hypothesize that various vermin spontaneously generate from the primordial "Ether" (the raw undifferentiated matter of creation) when certain formulae are fulfilled. A bag of grain left in a field will "spontaneously generate" mice. Uncovered water with no outlet will "spontaneously generate" algae and fungus.

Note that you can prove spontaneous generation true very easily by experimentation.

Not also that you can disprove it easily, if you deduct variables to exclude alternate explanations. But it takes "science" (deductive reasoning) to do that.

We have many literal Medieval Thinkers posing as scientists.

PS.

The reason why we have a "Presumption of innocence" in which the government must prove not merely that a crime occurred, but that ONLY a particular individual could have done it...beyond a reasonable doubt...is because the Founders had better science educations than modern scientists, who have returned to the medieval inductive reasoning method.

PPS

When you perform **INDUCTIVE** Reasoning Experiments to prove a hypothesis as True, your internal bias is inherently unfalsifiable.

You cannot falsify something while trying to prove it true.

Science IS NOT proving things True.

Science is **FAILING** to **DISPROVE** certain things as FALSE. Only then can you provisionally accept that the hypothesis works.

"Believe Science" is a **PERFECT INVERSION** of actual science.
